INTRODUCTION

You will be assigned a desktop computer with a set of problems for troubleshooting. Install a fresh copy of Windows 10. For the Windows 10 installation, please create a bootable drive using Rufus (we will demonstrate this during the lab). The goal for the lab is to have the computer boot into an operating system without any errors. For submission, please create a report detailing the troubleshooting process.

The report should follow documentation standards and have information that details the problems, desired result, and solutions.

TROUBLESHOOTING HARDWARE ISSUES

FIRST GLANCE

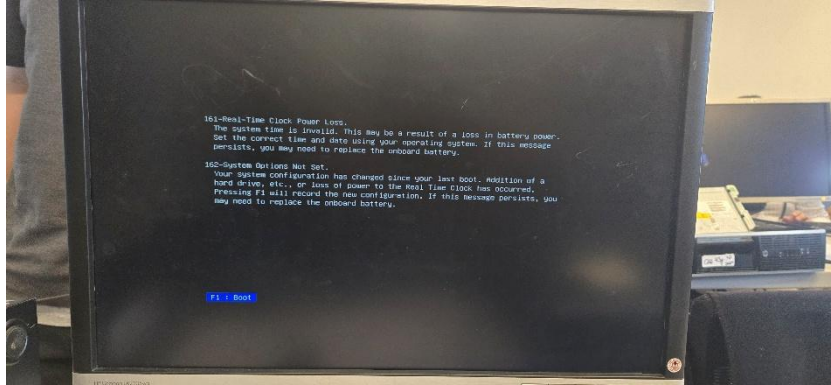

Upon first observation of the PC:

- The hard drive was not properly seated with no connection to power or data
- The optical drive was not connected to power or data
- The power supply was not connected to anything

RESOLUTION

1. Connected the 4 pin +4 pin 12V connector from the power supply to the motherboard
2. Connected the 6 pin PCIe Connector from the power supply to the motherboard
3. Connected the optical drive and hard drive with SATA power cable to the motherboard
4. Connected the optical drive and the hard drive individually with a SATA data cable.
5. Connected a VGA monitor, keyboard and mouse to the PC.
6. Turned the PC on and received a system clock error message

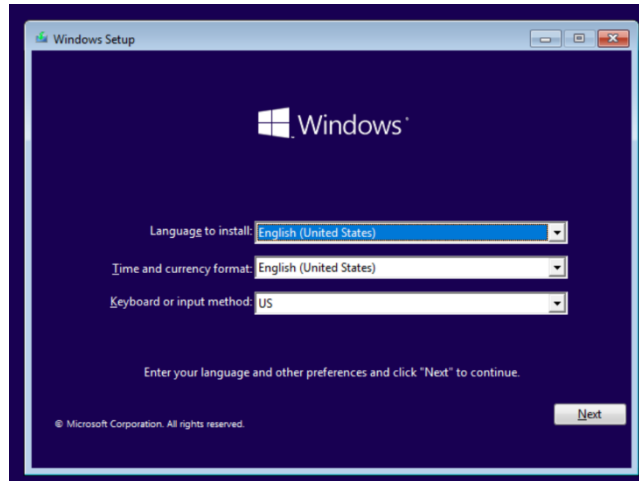

HARDWARE LAB

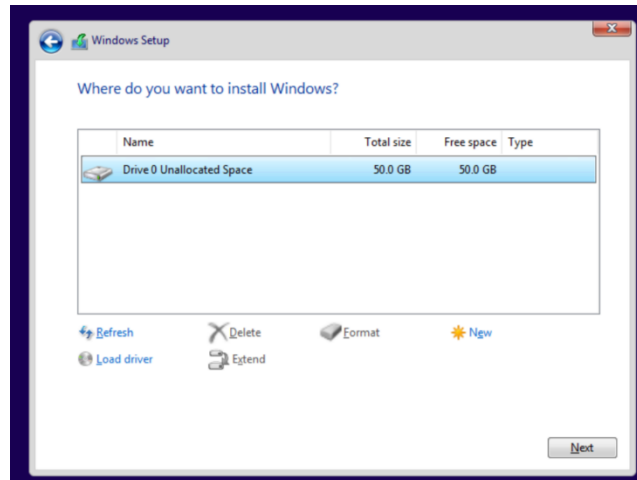

7. Pressed F1 to boot. Booted to Ubuntu successfully.

INSTALLING WINDOWS

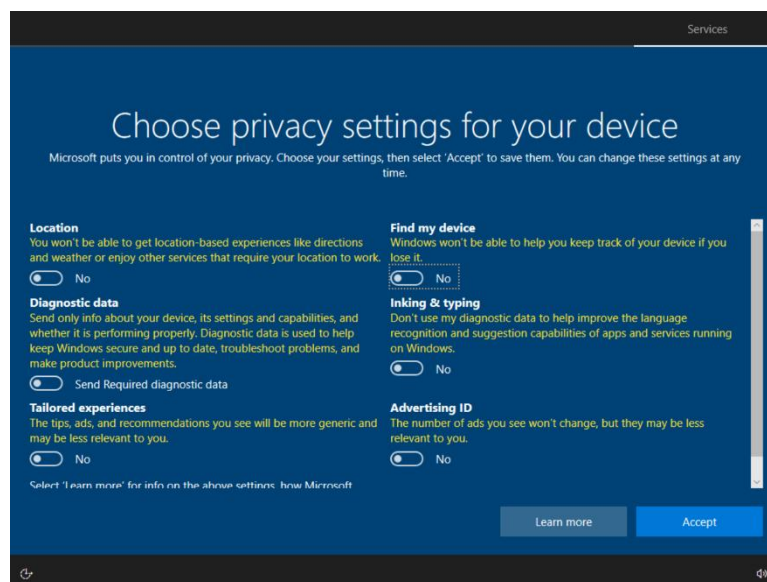

1. Language and Time & Currency set to English. Keyboard set to US. Click next

2. Selected Windows 10 Pro in window, Click Next.
3. Accepted license terms, Click Next
4. Selected drive to install windows, Click Next.

5. Wait patiently while windows installs
6. Restart.
7. Selected United States as the region. Click Yes.
8. Selected US as the keyboard layout. Click Yes.
9. Clicked Skip, to forego adding a second keyboard layout.
10. Selected Set up for personal use, Click Next.
11. Selected “Offline account” in the bottom left corner
12. Selected Limited experience, Click Next.
13. Enter a user name, password, confirm password, then choose security questions
14. Click not now, to forego connecting to your current browser and importing your history, favorites, and cookies
15. Choose your privacy settings, I prefer “No” for all. Click accept.

16. Click Skip, for experience customization.
17. Click “Not Now”, when asked to Let Cortana help you get things done.
18. Patiently wait. Windows installed successfully!
